AI-Powered Screenshot QA Automation

Got the idea → AI should review application screenshots for potential QA issues while considering weightless AI.

1. **Installed Python** → programming language for our application.
2. **Created the ScreenshotQA project folder** → contains code.
3. **Installed Ollama** → allows us to run AI locally.

Note: Ollama is a software that lets us run AI models locally on our computer.

In our project:

Ollama → runs Gemma 3 4B → provides an API → our app.py talks to it.

4. **Downloaded Gemma 3 4B** using Ollama:

Note: Gemma 3 4B = the AI model itself.

cmd

ollama pull gemma3:4b

5. **Created the QA prompt** inside my python code→ tells Gemma what to check: UI, UX, accessibility, spacing, alignment, text visibility, etc.
6. **Connected Python to Ollama's local API** → sends the screenshot + QA prompt to Gemma.
7. **Installed Streamlit** → used to create our web interface.
8. **Created app.py** → our main application code. It handles screenshot upload, Analyze button, AI request, and results.
9. **Started the application**:

cmd

streamlit run app.py

10. **Opened ScreenshotQA in the browser** → localhost:8501.

11. **Uploaded a screenshot → clicked Analyze → Gemma analyzed it → QA suggestions appeared.**

Final working flow

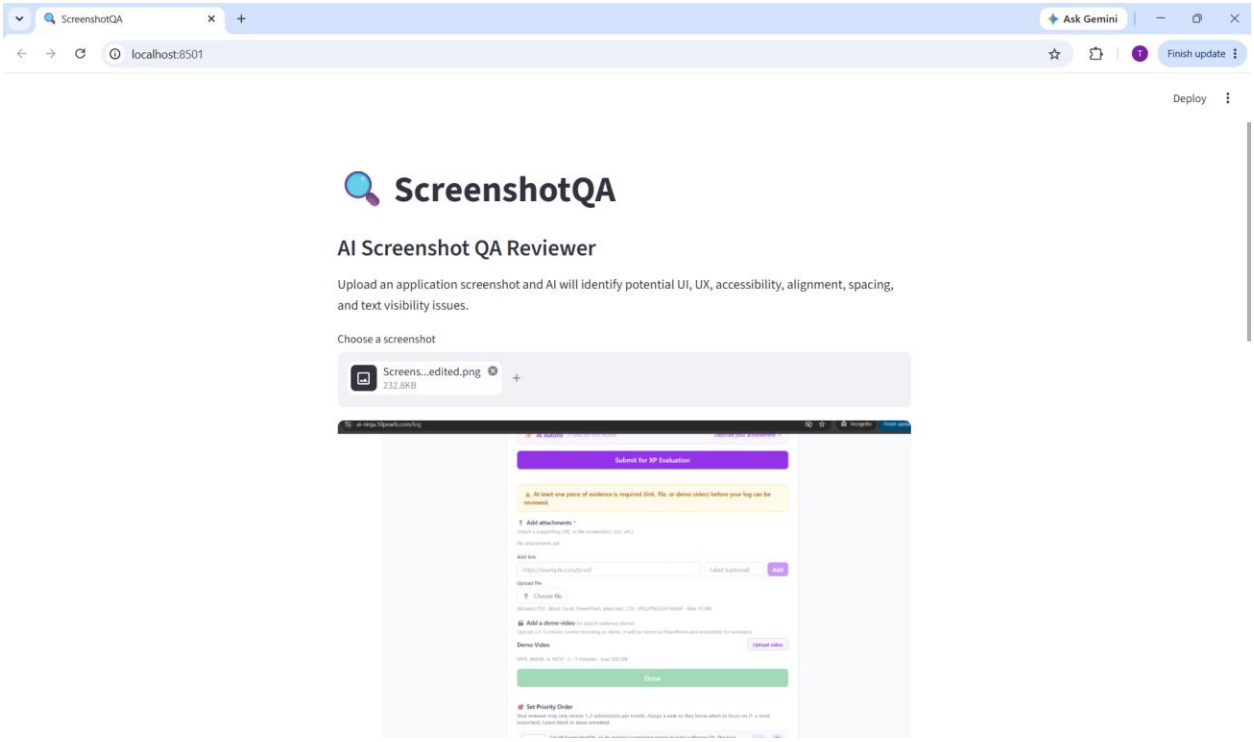

Screenshot → Streamlit UI → app.py → Ollama API → Gemma 3 4B → QA results → Streamlit UI.

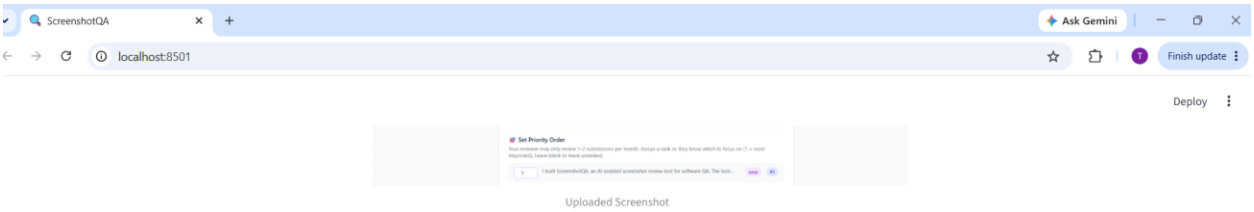

Run:

cd C:\Users\tahreem.fatima\ScreenshotQA

streamlit run app.py

How it works.

AI QA Review

Okay, here's a breakdown of potential issues identified from the screenshot, presented as requested:

1. Issue: The “Add attachments” section looks slightly cluttered with its nested inputs. **Category:** UX **Severity:** Low **Recommendation:** Simplify the “Add attachments” section. Consider a single file upload area with a clear label. A visual cue (e.g., a small icon) next to the label could also guide the user.

2. Issue: The "Add demo video" button is visually similar to the "Add attachments" section, making it easy for a user to accidentally click it. **Category:** UX **Severity:** Medium **Recommendation:** Change the label of the button from “Add demo video" to something more distinct, such as "Upload Video". Also, increase the padding around the button to visually separate it.

3. Issue: The "Set Priority Order" section is oddly placed and not clearly integrated with the main submission flow. It feels tacked on. **Category:** UX **Severity:** Low **Recommendation:** Move the "Set Priority Order" section to a more appropriate location, possibly below the main submission form or to a separate page. Consider providing a brief explanation of why this section is present.

4. Issue: Font size in "Set Priority Order" section is small. **Category:** Text Visibility **Severity:** Low **Recommendation:** Increase the font size to improve readability.

3. Issue: The "Set Priority Order" section is oddly placed and not clearly integrated with the main submission flow. It feels tacked on. **Category:** UX **Severity:** Low **Recommendation:** Move the "Set Priority Order" section to a more appropriate location, possibly below the main submission form or to a separate page. Consider providing a brief explanation of why this section is present.

4. Issue: Font size in "Set Priority Order" section is small. **Category:** Text Visibility **Severity:** Low **Recommendation:** Increase the font size to improve readability.

5. Issue: The alignment of the text within the "Set Priority Order" section is slightly off-center, especially the text describing the prioritization system. **Category:** Alignment/Spacing **Severity:** Low **Recommendation:** Adjust the horizontal padding of the text content to center it within the section.

6. Issue: The “AI AutoHi” text is not aligned to the left **Category:** Alignment/Spacing **Severity:** Low **Recommendation:** Make the text left aligned.

General Notes:

- **Overall Style Consistency:** It's difficult to fully assess the overall style and consistency of the application from this screenshot. However, the current design lacks a clear visual hierarchy and cohesive style guide.

Let me know if you'd like me to delve deeper into any specific area or if you can provide more context about the application's goals.

AI findings are potential issues. A QA engineer should validate them before logging bugs.
